-! FUNCTION: ACYL-PROTEIN SYNTHETAGE ACTIVATES TETRADECANOIC ACID.

IT IS A COMPONENT OF THE FATTY ACID REDUCTASE COMPLEX RESPONSIBLE FOR CONVERTING TETRADECANOIC ACID TO THE ALDEHYDE WHICH SERVES AS SUBSTRATE IN THE LOCIFERASE-CATALYZED REACTION.

-!- CATALYIC ACTIVITY: ATP + AN ACID + PROTEIN = AMP + PYROPHOSPHATE + AN ACYL-PROTEIN THIOLESTER.

-!- PATHWAY: SECOND STEP IN THE BIOLUMINESCENT FATTY ACID REDUCTASE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  01-NOV-1995 (Rel. 32, Created)

Chem. Hoppe-Seyler 373:133-142(1992).

-!- FUNCTION: THIS HORMONE, RELEASED FROM CELLS IN THE CORPORA CANDIACA AFFER THE BEGINNING OF FLIGHT, CAUSES RELEASE OF DIGLYCERIDES FROM THE FAT BODY AND THEN STIMULATES THE FLIGHT MUSCLES TO USE THESE DIGLYCERIDES AS AN ENERGY SOURCE.
-!- SIMILARITY: BELONGS TO THE AKH / HRTH / RPCH FAMILY.

                                                                                                                                                                                                                                                                                                                                                               or artigonists (Ib) of human carcinoembryonal artigon (CEA). (Ia) are used in vaccines to kill or inhibit carcinoma cells that express CEA or its epitopes, particularly for treating gastrointestinal, breast, pancreatic, bladder, ovarian, lung or prostatic carcinoma. They can also be used to proliferate T cells, e.g. from vaccinated subjects, for use in adoptive transfer therapy. (Ib) are used to inhibit CEA-specific immune responses, e.g. in vaccinated subjects, to prevent an autoimmune reaction to cancer immunotherapy (i.e. to prevent attack on normal but CEA-expressing cells). (Ia) are more active than native sequence (I) and generate a highly specific and systemic anti-CEA response. Cytotoxic T cells generated recognize both (ia) and native CEA epitopes. The present sequence represents a specifically claimed example of (Ia).
                                                                                                                                                                                                                                                                                                                                                       describes peptides (A) that comprise agonists (Ia)

or artagonists (ID) of human carcinoembryonal antigen (CEA). (Ia) are used in vaccines to kill or inhibit carcinoma cells that express CEA or its epitopes, particularly for treating gastrointestinal, breast, pancreatic, bladder, ovarian, lung or prostatic carcinoma. They can also be used to proliferate T cells, e.g. from vaccinated subjects, for use in adoptive transfer therapy. (Ib) are used to inhibit CEA-specific immune responses, e.g. in vaccinated subjects, to prevent an autoimmune reaction to cancer immunotherapy (i.e. to prevent attack on normal but cEA-expressing cells). (Ia) are more active than native sequence (I) and generate a highly specific and systemic anti-CEA response. Cytotoxic T cells generated recognize both (ia) and native CEA epitopes. The present sequence represents a specifically claimed example of (Ia).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Immunogenic peptide having a human leukocyte antigen binding motif #2296.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes peptides (A) that comprise agonists (Ia)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human leukocyte antigen; binding; immunogenic; glycoprotein; MHC; HLA; immune response; T cell activation; major histocompatibility complex; cytotoxic T lymphocyte; CTL; tunmour rejection; viral infection; cancer; prostate cancer; hepatitis B; hepatitis C; AIDS; renal carcinoma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

having a human major histocompatibility complex (MHC) class I (also having a human major histocompatibility complex (MHC) class I (also having a human leukocyte antigen (HLA) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes HLA-A2.1, Al, A3.2 or A24.1 or HLA-B or C) and induce a cyctotoxic T cell response against the antigen from which the peptide is derived.

Cyctoxic T lymphocytes (CTLS) which destroy antigen bearing cells are normally induced by an antigen in the form of a peptide fragment bound to a HLA molecule, rather than the intact foreign antigen itself, and are particularly important in tummour rejection and in fighting viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) are prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or useful diagnostically, and can be used to induce a cytotoxic T cell vith the peptide e.g. to produce CTLEs x vivo for infusion back into a patient. The polynucleotides encoding the immunogenic peptides are also useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Peptide antagonist (FCE 28883) of cellular mitogenesis and motogenesis.
                                                                                                                        New immunogenic peptides with HLA binding motif, useful in treatment and diagnosis of cancers and viral diseases
                                                                                                                                                                                                                                            Y45390 to Y48214 represent specifically claimed immunogenic peptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Peptide antagonist; mitogenesis; motogenesis; proliferative disease; cancer; tumour; phosphotyrosine; motif; SH2 domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      52.2%; Score 24; DB 20; Length 9; llarity 57.1%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Y45390 to Y48214 represent specifically claimed immunogenic peptides having a human major histocompatibility complex (MHC) Class I (also known as human leukocyte antigen (HLA) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes HA-AZ.1, Al, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell response against the antigen from which the peptide is derived. Cytotoxic T lymphocytes (CTLS) which destroy antigen-bearing cells are normally induced by an antigen in the form of a peptide fragment bound to a HLA molecule, rather than the intact foreign antigen itself, and are particularly important in tumour rejection and in fighting viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell response, by contacting a cytotoxic T cell with the peptide e.g. to produce CTLS ex vivo for infusion back into a patient. The pheroautically and for immunogenic peptides are also useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Immunogenic peptide having a human leukocyte antigen binding motif #2469.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human leukocyte antigen; binding; immunogenic; glycoprotein; MHC; HLA; immune response; T cell activation; major histocompatibility complex; cytotoxic T lymphocyte; CTL; tumour rejection; viral infection; cancer; prostate cancer; hepatitis B; hepatitis C; AIDS; renal carcinoma;

                                                                                                                                                                                                                                                              a phosphorylated tyrosine residue, which can bind to a cytosolic signal transducer and inhibit binding to a receptor tyrosine kinase or to another tyrosine phosphorylated transducer. It can interfere with cell motility, cell proliferation, cell invasiveness and tubulogenosis. It can be used in the control or treatment of proliferative diseases such as cancer, tumour growth and/or metastasis, and psoriasis, and in the control or treatment of inflammatory, allergic, autoimmune, viral and

Insulin-like growth factor binding protein; IBP; immunoprotective; anti-inflammatory; cytostatic; treatment; muscle loss; shrinkage; wastepoporosis; diabetees; amyloid lateral sclerosis; neuropathy; inflammation; cancer; neoplastic disease; growth disturbance; muscle; bone apparatus; wound healing; bone healing; gene therapy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     27 = phosphotycosine or its isostere;
28 = asparagine or its isostere;
the amino terminus is acylated, and the peptide is less than 14
residues in length, with the proviso that if 27 is phosphotyrosine
and 28 is asparagine, then the peptide is not GDGZ7XZ8XPLL.
These SH2 binding peptides are used to treat of diagnose diseases
associated with aberrant cell growth, differentiation or regulation
which is associated with defects in receptor tyrosine kinase pathways,
by partially blocking or inhibiting a cellular signal transduction
pathway. The disease may be cancer, a developmental or differentiation
disease or insulin-resistant (or non-insulin dependent) diabetes.
                                                                                                                                                                                                                                                                                                                                                                                2 (SH2)

This peptide is a tyrosine-contg, mol. representing a site of tyrosine phosphorylation. The peptides of the invention comprise a portion of the intracellular region of the human hepatocyte growth factor receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
This is a constituent peptide of a purified human elastase inhibitor (EI) which is capable of forming a covalent complex with elastase and acting as an inhibitor of the elastinolytic activity of elastase. The EI is useful in the treatment of conditions such as cystic fibrosis or bronchiectasis. The Abs may be used e.g. to diagnose rheumatological diseases, idiopathic diseases and inflammatory diseases or as a diagnostic tool for e.g. neoplastic or genetic diseases. The corresp. gene may be used in gene replacement therapy. See also R06900-08
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          intracellular region; human hepatocyte growth factor; hHGF; receptor; cytosolic signal transducer binding; cell proliferation; movement; extracelllular matrix invasion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New peptide(s) which bind to a cytosolic signal transducer - used for interfering with pathways leading to cell proliferation and motility, for treating neoplastic disease

                                                                                                             ö
(HHGFR), and can generally reproduce potential recognition motifs for the SH2 domains of intracellular (cytosolic) signal inducers. The peptides can interfer with pathways leading to cell proliferation, movement and extracellular matrix invasion. They can be used to inhibit growth of neoplastic cells and to prevent metastatic spreading.

The method involves the identification of peptide sequences capable of binding to an HLA (human leukocyte antigen) class I molecule and measuring the binding of this epitope peptide to the HLA class I peptide. The stability of binding of the peptide and MHC (major histocompatability chast indicule is measured on intact human B cells carrying the MHC molecule at their cell surfaces. The method can be used to select peptide epitopes for generating vaccines against a disease associated with the polypeptide, e.g. cancers or AIDS. The peptide epitopes are especially T-cell peptide epitopes with strong anti-tumour and anti-viral immune responses. Peptide W39723 is derived from the human carcino-embryonic antigen (CEA) and has the ability to bind to the human

Sequences shown in W70044 to W70052 represent peptides derived from carcinoembryonic antigen (UEA). The peptides can bind to a human carcinoembryonic antigen (HEA), HLA-A2.1 and are used to examplify the method of invention of producing antigen-specific cytotoxic T cells (CTLs) in vitro. The method comprises contacting immunogenic peptides from an antigen that binds class I major histocompatibility complex (MHC) molecules with antigen presenting cells (MPCs) pretreated with presence of at least 2 incubation growth factors, thereby producing antigen-specific CTLs. A method for specifically killing target cells in the presence of at least 2 incubation growth factors, thereby producing antigen-specific CTLs. A method for specifically killing target cells in a human patient is also provided which comprises obtaining a fluid sample containing CTLs from a patient, contacting the cytotoxic T cells with APCs pretreated with pre-treatment growth factors, where the APCs comprise class I MHC molecules. The pretreated APCs are incubated with the cytotoxic growth factors, thereby producing activated composition can then be administered to the patient. The activated CTLS with be used for treating cancers, immune disorders, viral infections,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SHC phosphopeptide; binding; src homology 2 domain; SH2 domain; Grb2; signal transduction protein; non-phosphorylated; inhibition; treatment; hyper-proliferative disease; human cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                          The peptide epitope W77119-W77138 were created for human tumour-specific cytocoxic T lymphocyte response. These peptides are are cysteinedepleted mutants of a native disease-specific CTL epitope. The cysteinedepleted CTL epitopes elicit a stronger or more specific CTL response than the native epitope. The epitopes can be used in a disease-specific timunogen to protect a mammal against disease in particular melanomas. The peptides may also be used to screen a sample for the presence of an antigen with the same epitope, or with a different cross-reactive
                                                                                                                                                                                                                                                                                                                                                       Disease specific immunogen – comprises disease specific cytotoxic T lymphocyte epitope used to elicit melanoma specific CTL response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents a SHC phosphopeptide that is capable of binding to the str homology 2 (SH2) domain of GTb2. GTb2 is a signal transduction protein. The specification describes a non-phosphorylated peptide (W46896) that binds to the SH2 domain of Grb2 with affinity similar to, or greater than, that of the present sequence. This non-phosphorylated peptide contains a tyrosine residue that has not been modified by phosphate or similar charged group. The non-phosphorylated peptide is used to inhibit a signal transduction process that involves binding of a phosphorylated protein or peptide to the SH2 domain of a signal transduction protein, particularly GTb2. It is used specifically for treatment of hyper-proliferative diseases, especially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New peptides which selectively home to organs or tissues, used for, e.g. identifying target ligands and for therapy of pathological conditions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Homing peptide; organ; tissue; lung; pancreas; skin; retina; MDP; prostate; ovary; lymph node; adrenal gland; liver; gut; tumour; membrane dipeptidase.

The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes HLA-A2.1, A1, A3.2 or A24.1 or HLA-B or C) and induce a cytocoxic T cell response against the antigen from which the peptide is derived. Cytocoxic T lymphocytes (CTLS) which destroy antigen-bearing cells are normally induced by an antigen in the form of a peptide fragment bound are particularly important in tumour rejection antigen itself, and are particularly important in tumour rejection and in flighting viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Immunogenic peptide having a human leukocyte antigen binding motif #2266.
The present invention describes peptides that selectively home to a tissue or organ. The peptides can be used for identifying an organ or tissue, for identifying a target molecule expressed by an organ or tissue or for treating an organ or tissue or for treating an organ or tissue pathology, where the organ or versue is selected from prostate, lung, skin, retina, pancreas, gut, meaning and administrate of liver, and lymph node. The peptide bind to the membrane dipeptidase (MDP). Y48618 to Y49066 represent sequences which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human leukocyte antigen; binding; immunogenic; glycoprotein; MHC; HLA; immune response; T cell activation; major histocompatibility complex; cytotoxic T lymphocyte; CTL; tumour rejection; viral infection; cancer; prostate cancer; hepatitis B; hepatitis C; AIDS; renal carcinoma;

A HSP-antigen complex is useful as a vaccine for treating an allergic disease (in a mammal, preferably a human) to reduce susceptibility of the Th2 response, the complex comprising a HSP-antigenic peptide complex. The complex is administered to prevent a mammal from having an allergic reaction to an allergic disease, or administered to a mammal having an allergic disease, or reduce the allergic reactions. Allergic diseases include asthma and skin rashes. Prior art methods or preventing/treating allergic diseases include antihistamines which treat only the symptoms, corticosteroids which have severe side effects and desensitization there are performed as prior at HSP-based (flexibility of use of peptide-based vaccines, as prior art HSP-based

e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytocoxic T cell response, by contacting a cytocoxic T cell with the peptide e.g. to produce CTLS ex vivo for infusion back into a patient. The polynucleotides encoding the immunogenic peptides are also useful therapeutically and for immunisation as above.
                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             its epitopes, particularly for treating gastrointestinal, breast, pancreatic, bladder, ovarian, lung or prostatic carcinoma. They can also be used to proliferate T cells, e.g. from vaccinated subjects, for use in adoptive transfer therapy. (Ib) are used to inhibit CEA-specific immune responses, e.g. in vaccinated subjects, to prevent an autoinmune reaction to cancer immunotherapy (i.e. to prevent attack on normal but CEA-expressing cells). (ia) are more active than native sequence (I) and generate a highly specific and systemic anti-CEA response. Cytotoxic T cells generated recognize both (ia) and native CEA epitopes. The present sequence represents a specifically claimed example of (ia).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes peptides (A) that comprise agonists (Ia)
require isolation from a portion of the tumour itself. This represents a peptide fragment derived from the HIV pol protein used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             or antagonists (1b) of human carcinoembryonal antigen (CEA). (1a) are used in vaccines to kill or inhibit carcinoma cells that express CEA or

                                                                                                                                                                                                                                                                                                                                                     Six degenerate oligonucleotide primer sets were made to correspond to regions of amino acids highly conserved among previously described g protein alpha subunits. The primers were used for PCR with DNA from a taste cell library as template. Partial clones and further PCR primers were used to isolate a composite gustatory alpha subunit clone or gustducin gene clone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human leukocyte antigen; binding; immunogenic; glycoprotein; MHC; HLA;

having a human major histocompatibility complex (MHC) class I delico known as human leukocyte antigen (HLA) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes HLA-A2.1, A1, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell response against the antigen from which the peptide is derived.

Cytotoxic T lymphocytes (CTLS) which destroy antigen bearing cells are normally induced by an antigen in the form of a peptide fragment bound to a HLA molecule, rather than the intext foreign antigen itself, and are particularly important in tumour rejection and in fighting viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell with the peptide e.g. to produce CTLS ex vivo for infusion back into a patient. The product of the immunogenic peptides are also useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes polypeptides (I) comprising an immunogenic portion of a native Wilm's Tumour gene product polypeptide, WTI, or variants of the immunogenic portion retaining the ability to react with WTI-specific antisera and/or T-cell lines or clones) and comprising 16 consecutive amino acids (aa) or less of a native WTI polypeptide. The polypeptides are useful therapeutically and to manufacture medicaments for enhancing/inducing an immune response in patients. The polypeptides, mimetros or polypuclectides can be included with a carrier/excipient in pharmaceutical compositions or with a conspecific immune response enhancer (e.g. an adjuvant or enhancer preferentially enhancing a T cell response) in vaccines. Pharmaceutical compositions and vaccines can be administered to human patients to enhance or induce an immune response specific for WTI or a cell compositions with wTI expression, e.g. leukemia (especially associated with WTI expression, e.g. leukemia (especially cure/chronic myeloid leukemia or acute lymphocytic leukemia) or cancer (especially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .;

The present invention describes polypeptides (I) comprising an immunogenic portion of a native Wilm's Tumour gene product polypeptide, Wilm's Tumour gene product polypeptide, Wil, (or variants of the immunogenic portion retaining the ability to react with WTI-specific antisera and/or T-cell lines or clones) and comprising 16 consecutive amino acids (aa) or less of a native WTI comprising 16 consecutive amino acids (aa) or less of a native WTI comprising 16 consecutive amino acids (aa) or less of a native WTI comprising 16 consecutive amino acids (aa) or less of a native WTI comprising 16 consecutive amino acids (aa) or less of a native WTI companies. The polypeptides are useful therapeutically and to manufacture medicaments for enhancel compositions or with a non-specific immune response enhancer (e.g. an adjuvant or achievement or preferentially enhancing a T cell response) in vaccines. Pharmaceutical compositions and vaccines can be administered to human patients to compositions and vaccines can be administered to human patients to compositions and vaccines can be administered to human patients to composition and vaccines can be administered to human patients to composition and vaccines can be administered to human patients or associated with WTI expression, e.g. leukemia (especially acute/chronic myeloid leukemia or acute lymphocytic leukemia) or cancer (especially breast, lung, thyroid or gastrointestinal cancer, or a melanoma). Y98501 to Y98811 represent polypeptide sequences, and A1386 to A13862 represent con the paremental control co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WT1; immunotherapy; immunogenic; malignant disease; cancer; leukaemia; metastatic disease; mouse; human; Wilm's tumour; immune response;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes polypeptides (I) comprising an immunogenic portion of a native Wilm's Tumour gene product polypeptide, WT1, (or variants of the immunogenic portion retaining the ability to react with WT1-specific antiscra and/or T-cell lines or clones) and comprising 16 consecutive amino acids (aa) or less of a native WT1 comprising 16 consecutive amino acids (aa) or less of a native WT1 comprising 16 consecutive amino acids (aa) or less of a native WT1 compositions. The polypeptides are useful therapeutically and to patients. The polypeptides are useful therapeutically and to patients. The polypeptides, mimetics or polynucleotides can be included to patients. The polypeptides, mimetics or polynucleotides can be included to non-specific immune response enhancer (e.g. an adjuvant or enhancer or preferentially enhancing a T cell response) in vaccines. Pharmaceutical compositions and vaccines can be administered to human patients to enhance or induce an immune response specific for WT1 or a cell expressing WT1, useful to inhibit the development of malignant diseases associated with WT1 expression, e.g. leukemia) or cancer (especially compositions and acid or systemic confortion or gastrointestinal cancer, or a melanoma). The present invention describes polypeptides (1) comprising an immunogenic portion of a native Wilm's Tumour gene product polypeptide, WIT, (or variants of the immunogenic portion retaining the ability to react with WIT-specific antisers and/or T-cell lines or clones) and comprising 16 consecutive amino acids (aa) or less of a native WIT comprising 16 consecutive amino acids (aa) or less of a native WIT conjypeptide. The polypeptides are useful therapeutically and to manufacture medicaments for enhancing/inducing an immune response in patients. The polypeptides winentics or polynocleotides can be included on specific immune response enhancer (e.g. an adjuvant or enhancer preferentially enhancing a T cell response) in vaccines. Pharmaceutical compositions and vaccines can be administered to human patients to enhance or induce an immune response enhance to enhance an immune response specific for WIT or a cell expressing WIT, useful to inhibit the development of malignant diseases associated with WIT expression, e.g. leukemia (especially acute/chronic myeloid leukemia or acute lymphocytic leukemia) or cancer (especially breast, lung, thyroid or gastrointestinal cancer, or a melanoma). Y98501 to Y98811 represent polypeptide sequences, and A13862 represent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WT1; immunotherapy; immunogenic; malignant disease; cancer; leukaemia; metastatic disease; mouse; human; Wilm's tumour; immune response; vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                              Novel polypeptides comprising an immunogenic portion of a native WT1 polypeptide, useful for inhibiting the development of malignant diseases associated with WT1 expression e.g. leukemia or cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ;

gamma-chain of cytokine receptors, and interacts with a cytokine or a gamma-chain partner receptor chain of a heterodimeric cytokine ereceptor. They inhibit signal transduction mediated by cytokine: receptor. In they inhibit signal transduction mediated by cytokine: receptor. In they inhibit or suppress cytokine-mediated immune responses, growth, proliferation, function and activity of cells. Particularly they are used for treatment or prevention of lymphoma, leukeemia, allergy are used for treatment or prevention of lymphoma, leukeemia, allergy multiple sclerosis or myasthenia gravis), graft vs. host disease and transplant or graft rejection. They inhibit function of interleukin (IL)-2, -4, -7, -9, -13 and -15 (the receptors for which include a common gamma -chain), so function as immunosuppressants by reducing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes polypeptides (I) comprising an immunogenic portion of a native Wilm's Tumour gene product polypeptide, WT1, (or variants of the immunogenic portion retaining the ability to react with WT1-specific antisera and/or T-cell lines or clones) and comprising 16 consecutive amino acids (aa) or less of a native WT1 comprising 16 consecutive amino acids (aa) or less of a native WT1 comprising 16 consecutive amino acids (aa) or less of a native WT1 comprising 16 consecutive amino acids (aa) or less of a native WT1 comprising 16 consecutive amino acids (aa) or less of a native WT1 comprising 16 consecutive medicaments for enhancing/inducing an immune response in patients. The polypeptides, minetics or polynucleotides can be included on on-specific immune response enhancer (e.g. an adjuvant or enhancer preferentially enhancing a T cell response) in vaccines. Pharmaceutical compositions and vaccines can be administered to human patients to compositions and vaccines can be administered to human patients to compositions and vaccines can be administered to human patients to compositions and vaccines can be administered to human patients to composition and vaccines can be administered to human patients to composition and vaccines can be administered to human patients of associated with WT1 expression, e.g. leukemia) or cancer (especially breast, lung, thyroid or gastrointestinal cancer, or a melanoma). F98501 cor 98811 represent polypeptide sequences, and A13848 to A13862 represent cor correct c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Peptide mimetic; gamma-chain; cytokine receptor; signal transduction; autoimmune disease; graft vs. host disease; transplant rejection; graft rejection; interleukin; immunosuppressant; T cell; B cell.

The peptide mimetics W61734-W61756 and W77001-W77014 mimic a loop on the gamma-chain of gytokine receptors, and interacts with a cytokine or a gamma-chain partner receptor chain of a heterodimeric cytokine receptor. They inhibit signal transduction mediated by cytokine:receptor binding (of cytokines that bind to receptors with a gamma-chain). They are used to inhibit or suppress cytokine-mediated immune responses, growth, proliferation, function and activity of cells. Particularly they are used for treatment or prevention of lymphoma, leukaemia, allergy (e.g. asthma), autoimmune disease (e.g. rheumatoid arthritis, lupus, multiple sclerosis or myasthenia gravis), graft vs. host disease and transplant or graft rejection. They inhibit function of interleukin (L1)-2, -4, -7, -9, -13 and -15 (the receptors for which include a common proliferation of T and B cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1..8
/note= "the terminal residues are condensed with each
    other to form a cyclic peptide"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        inhibition; cadherin extracellular domain; cell adhesion recognition; OB-cadherin-7; cadherin-7; cadherin-7; cadherin-7; cadherin-12; cadherin-12; cadherin-12; cadherin-12; cadherin-13; T-cadherin; PB-cadherin; cadherin related neuronal receptor; LI-cadherin; protocadherin; desmoglein; desmoclin; calcium binding; cancer; tumour; obesity; rheumatoid arthritis; multiple sclerosis; diabetes; metastasis; neurological disease; cyclic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes cadherin modulating agents (MA)

Comprising peptides which comprise a nonclassical cadherin cell adhesion

Comprisition (CAR) sequence. The MAs can be used for modulating

conclassical cadherin-mediated functions. They can be used for e.g.

inhibiting adhesion of nonclassical-cadherin expressing cells in a

conclassical cadherin-mediated functions. They can be used for e.g.

inhibiting adhesion of nonclassical-cadherin expressing cells in a

confamily, inhibiting metastasis of a cancer in a mammal, inhibiting

confidences in a mammal, inducing apoptosis in a nonclassical cadherin-

confidences in a mammal, enhancing delivery to the

contral nervous system, treating a demyelinating neurological disease,

contral nervous system, treating a demyelinating neurological disease,

conclassical cadherin-expressing cells, inhibiting synaptic stability in

conclassical cadherin-expressing cells, inhibiting synaptic stability in

a mammal, or preventing pregnancy in a mammal. They can also be used for

cor reducing scar tissue, or enhancing adhesion of foreign tissue in a

conclastic can also be used for treating e.g. psoriasis, arthritis,

age-related macular degeneration, multiple sclerosis and diabetes. The

products can also be used for detection and diagnosis and in

concreactors. Y60592 to X64572 represent specifically claimed peptides,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ò
                                                                                                                                                                                                                                                     The present invention describes cadherin modulating agents (MA)

comprising peptides which comprise a nonclassical cadherin cell adhesion

cecognition (CAR) sequence. The MAs can be used for modulating

nonclassical cadherin-mediated functions. They can be used for e.g.

inhibiting adhesion of nonclassical-cadherin expressing cells in a

can mammal, enhancing delivery of a drug through the skin of a mammal,

can mammal, inhibiting metastasis of a cancer in a mammal, inhibiting

can giogenesis in a mammal, inducing apoptosis in a nonclassical cadherin-

expressing cell, preventing or treating obesity in a mammal, stimulating

contral nervous system, treating a demyelinating neurological disease,

increasing vasopermeability in a mammal, enhancing adhesion of

conclassical cadherin-expressing cells, inhibiting synaptic stability in

a mammal, or preventing pregnancy in a mammal. They can also be used for

c.g. enhancing or directing neurite outgrowth, facilitating wound healing

cor reducing scar tissue, or enhancing adhesion of foreign tissue in a

conclassical table macular degeneration, multiple scloresis and diabetes. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          products can also be used for detection and diagnosis and in
bioreactors. Y60592 to Y64572 represent specifically claimed peptides,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        R59104-264 are immunogenic 9mer peptides that contain a HLA-A2.1 binding motif. These peptides bind HLA-A2.1 and have a binding affinity of at least 1% as compared to a reference peptide (R71233). R59112 has an ICSO of 0.29 and the sequence occurs at position 1279 in the HBV POL protein. The peptides of the invention can induce cytotoxic T lymphocytes which can react with target cells. They can be used for the treatment or prophlyaxis of cancer, eg. prostate cancer or lymphoma, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               antigen; epitope; immunogenic target protein; PSA; HBVc; HBVs; EBV; HTVI; core antigen; surface antigen; pharmaceutical composition; in vivo; ex vivo; therapeutic; diagnostic; MHC class I molecule; major histocompatability complex; HLA-A2.1; 9mer; 10mer; anchor;
                                                                                                                                                                                                                                                                                                                                                                           Immunogenic peptide(s) having an HLA-A2.1 binding motif - used for treatment or prophylaxis of cancer, virus infection or autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;;

Peptides R70066-7 are control peptides in an assay for stimulation of vytocoxic T cells (CTLS) by epitopes from the heptitis B virus (HBV) polymerase (HBpol) (see R70044-59). The HBpol peptides can be used, prophylactically as vaccines, together with, or conjugated to, HBV helper epitopes (R70060-4). The peptides can be used, particularly ex vivo, to stimulate CTL cells,which cells can be reintroduced into patients who have chronic or acute HBV infections or are carriers, especially in treatments to prevent conversion from acute to chronic infections.
                                                                                                                                                                                                                                                                                                                                             Hepatitis B virus polymerase; cytotoxic T cell response; prophylactic; vaccine; chronic; acute HBV infection; carrier.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New peptides inducing cytotoxic T lymphocytes to hepatitis B virus - are regions of HB polymerase protein, for treating acute and chronic infections
                                                                                                                                                                                                                                                                                                                 Control peptide 927.30 for HBV epitope stimulation of T-cells.

                                                                                                                                          R59104-264 are immunogenic 9mer peptides that contain a HLA-A2.1 binding motif. These peptides bind HLA-A2.1 and have a binding affinity of at least 1% as compared to a reference peptide (R71293). R59233 has an IC50 of 0 and the sequence occurs at position 614 in the HIV POL protein. The peptides of the invention can induce cytotoxic T lymphocytes which can react with target cells. They can be used for the treatment or prophlyaxis of cancer, eg. prostate cancer or lymphoma, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               R70596 is a peptide fragment derived from an HIV (Human Immunodeficiency Virus) protein and is capable of binding to a human lymphocyte antigen. The peptide can induce killer cells which target HIV-infected cells. It is also useful in the prevention and treatment of HIV and AIDS. Anti-HIV vaccines may incorporate the peptides, or may incorporate a vector (such as vaccinia or BCG) contg. DNA encoding the peptides.
                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           O-Malonyl-tyrosine derivatives (Y0294-Y09296). The peptides are useful for disease treatment or prevention by affecting signal transduction pathways of cells. e.g. to inhibit binding interactions of the Pl-3 kinase C-terminal p85 SH2 domain, the Src SH2 domain, the Grb2 SH2 domain or the N-terminal SH-PPPS SH2 domain with ligands and are useful for treatment or prevention of diseases, especially cancer (optionally in combination with chemo- or radiotherapy), diabetes or immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                  O-Malonyl-tyrosine; derivative; signal transduction; binding; Src; Pl-3 kinase; SH2 domain; Grb2; SH-PTP2; ligand; cancer; therapy; diabetes; immune dysfunction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to the generation of peptides containing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SH2 domain; binding; inhibition; interaction; site specific;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New O-malonyl-tyrosine derivs. - useful as protein-tyrosine phosphatase inhibitors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Length 9;

method has been developed of inhibiting a site-specific interaction between a first molecule having an SH2 domain and a second molecule that between a first molecule having an SH2 domain and a second molecule that interacts with the SH2 domain. The method comprises contacting the first complexity and RH and the septide containing a sequence of formula: RH-MET-R3-Met (1), where RH = phosphotyrosine (PTyr) or a phosphotyrosine analogue having a hydrolysis-resistant phosphorous complexy, and RB = any amino acid. W78501 to W78521 represent specifically claimed examples of the peptides described. The peptides are useful for modulating both cellular growth to control unwanted cell proliferation in e.g selected malignancies and for metabolic control in e.g. diabetes, by inhibiting signal transduction molecules such as protein tyrosine concogene products and the insulin receptor. The peptides are also useful for for tracting and for studying the enzymatic mechanisms of PTPase activity and the metabolic and blochemical roles of PTPases. W78702 represent other peptides given in the present invention, but
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

MHC class I histocompatibility antigen Ch28 alpha chain precursor - chimpanzee
C;Species: Pan troglodytes (chimpanzee)
C;Species: Pant-1997 *sequence_revision 19-Mar-1997 *text_change 21-Jan-2000
C;Accession: S07114
R;Lawlor, D. A.; Ward, F.E.; Ennis, P.D.; Jackson, A.P.; Parham, P.
Nature 335, 268-271, 1988
A;Title: HLA-A and B polymorphisms predate the divergence of humans and chimpanzees.
A;Reference number: S06424; MUID:88319000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A; Molecule type: mRNA
A; Residues: 1-345 < LAW>
C; Superfamily: class I histocompatibility antigen; immunoglobulin homology
C; Reywords: glycoprotein; membrane protein
F; 217-282/Domain: immunoglobulin homology < IMM>

A.Title: Cloning of a novel water and urea-permeable aquaporin from mouse expressed strc. A:Reference number: JC5806; MJID:98049830
A:Rocession: JC5806
A:Molecule type: mRNA
A:Residues: 1-261 <AAA>
A:Cross references: DDBJ:AF018952; NID:92353796; PIDN:AAB68847.1; PID:92353797
C:Comment: This protein functions as a mercurial-sensitive water channel.
C:Superfamily: lens fiber membrane major intrinsic protein
C:Superfamily: lens fiber membrane major intrinsic protein
C:Superfamily: NPA motif
F:320-212/Region: NPA motif
F:35.139/Binding site: carbohydrate (Asn) (covalent) #status predicted
